

# New FISH Probes for Cancer Research

**Sensitivity. Specificity. Reproducibility.**

Abnova provides a collection of FISH probes targeting various potential prognostic biomarkers supports specifically in the field of oncology. With meticulous quality control, our cytogenetic probes ensure highest hybridization efficiency ready for rapid identification of chromosomal abnormalities, such as amplifications, translocation, fusion and splitting, frequently encountered across genome. Designed for the purpose of pin-pointing DNA targets in cells and in tissues, our FISH probes can unquestionably facilitate cancer research including areas such as lung adenocarcinoma, ovarian cancer, pancreatic cancer, prostate cancer and more.

ACTN4 DF0001  
(human pancreatic cancer)

ACTN4 DF0002  
(human lung cancer)

AR FG0163  
(human prostate cancer)

BRCA1 FG0069  
(human lymphocyte - interphase)

CD274(PD-L1) FG0160  
(human DLBCL)

CD274(PD-L1) FG0160  
(human lung adenocarcinoma)

CD274(PD-L1) FG0160  
(human ovarian cancer)

CD274(PD-L1) FG0160  
(human renal cell carcinoma)

EGFR FG0114  
(human lung cancer)

EML4/ALK FT0009  
(human lung cancer)

ERBB2 (HER2) FG0166  
(human breast cancer)

ERG FS0008  
(human prostate cancer)

MYC FG0117  
(NCI-N417 cell line)

p53 FG0011  
(human lymphocyte - metaphase)

PDCD1LG2(PD-L2) FG0161  
(human DLBCL)

PLS3 FG0164  
(human lung adenocarcinoma)

PTEN FG0019  
(human lymphocyte - interphase)

PRDM14 FG0165  
(human breast cancer)

TOP2A FG0119  
(human breast cancer)

JAK2 FG0162  
(human DLBCL)
